

Mealworms!!!!

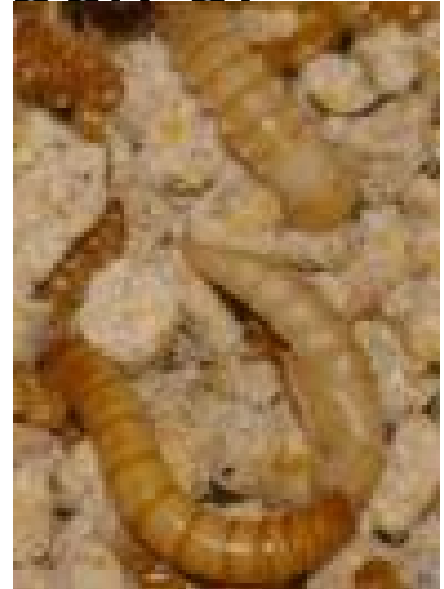

*The Darkling beetle lays eggs.
Mealworms drink the potato and
they eat wheat germ. We all got
2 or 3 mealworms. Some
mealworms died and they look
like black worms.*

By: Marlis

Mealworm hatch from their eggs. We don't get to see the eggs because they are so small. Some of the eggs are yellow and white. The eggs look like a little rock of sand.

When a mealworm turns into pupas they don't move at all. The pupa is white. It takes 2 weeks or more for a pupa to hatch. We never saw a pupa hatch.

When the pupas hatch they turn into white Darkling Beetles. Then they are red and finally they turn black. The beetles have 6 legs. Beetles have antennas on there head
